

# Ward 2: Non-fatal Opioid Overdoses

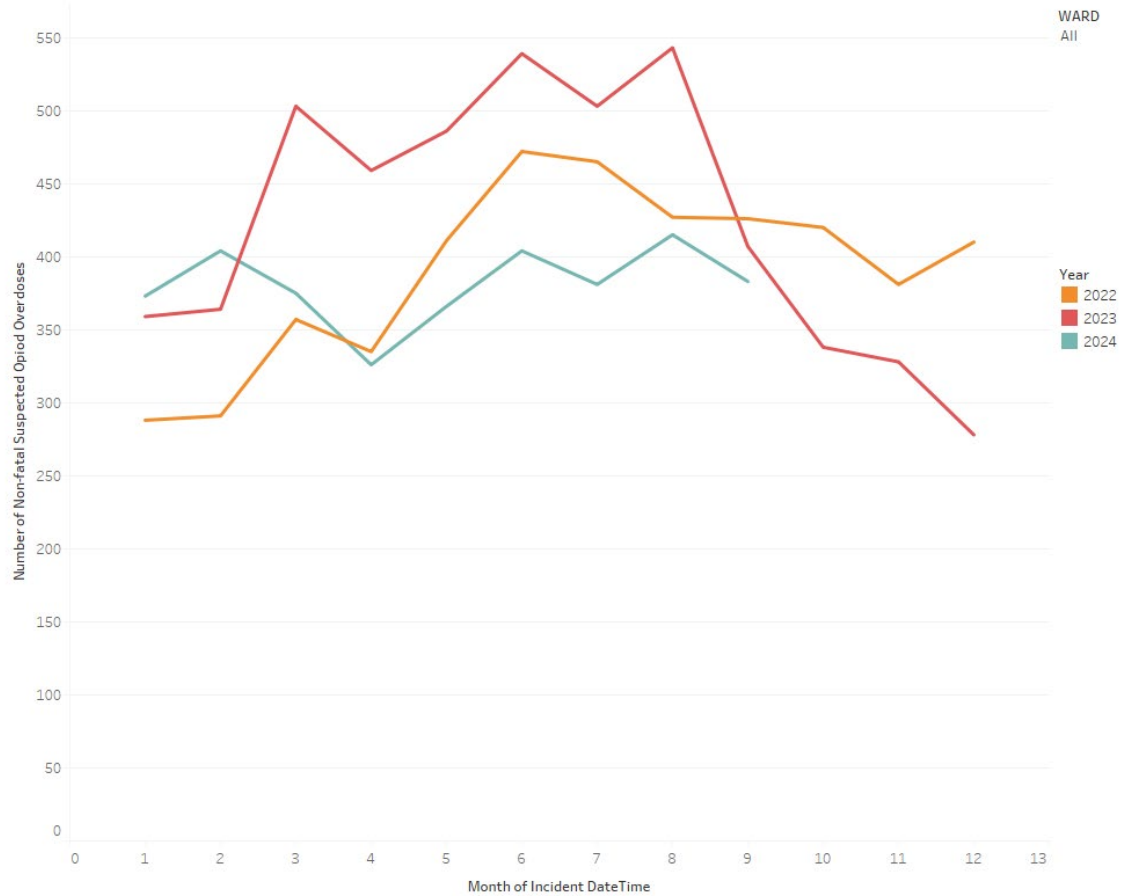

---

October 2024

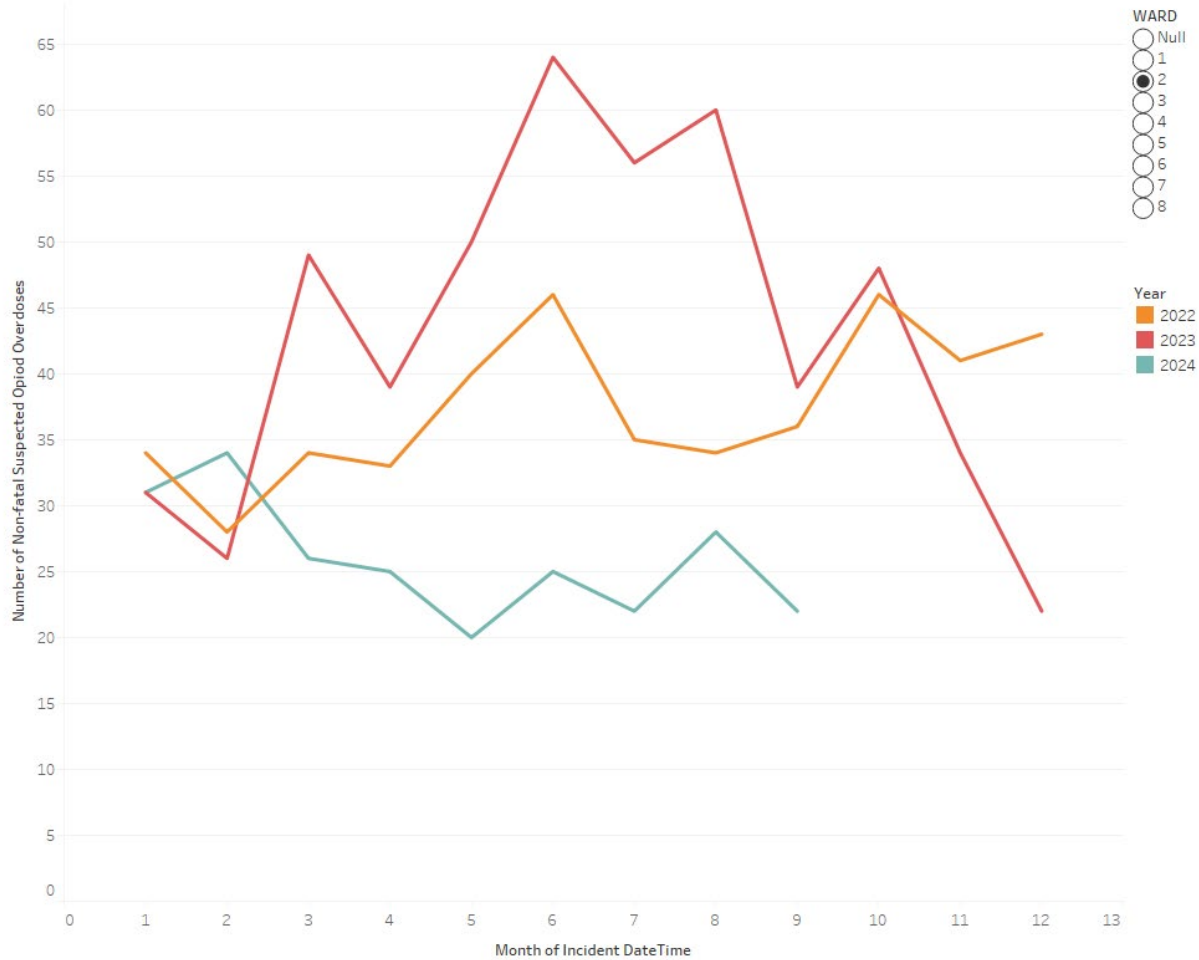

Maura Nakahata | 10/1/2024

- What is considered a non-fatal opioid overdose?
  - An opioid overdose is determined by an EMS provider’s clinical determination or improvement in the patient’s condition following naloxone administration.
- What is not included in these data
  - Overdose victims who did not have a 9-1-1 call placed for them and therefore did not interact with EMS.
  - Overdoses without enough geographic information to determine in which Ward the incident occurred. As such, the data likely underrepresents total opioid overdoses in a particular Ward.
  - Overdoses that were ultimately fatal following transport to the emergency department.
